

Deployment Tracker

Portal Redesign

What is the Deployment Tracker?

An internal web portal for Nokia's Project teams to track monthly product opportunities, purchase orders, and milestone-level deployment progress across multiple customers and divisions

The portal connects data from Accounts → Customers → Opportunities → POs → Milestones into one unified workflow.

20

Database tables
across 3 categories

4

Stakeholder
role types

8

Milestone stages
per product

Why Are We Rebuilding It?

Overwhelming interface

Dense spreadsheet-like tables with no visual cues for status, ownership, or priority. Users spend significant time finding relevant information.

No deployment journey visibility

No way to see where an opportunity is in the Hub → WH → Site → Install → Integration → RFS flow at a glance. Milestone dependencies and next steps are invisible.

Repetitive manual data entry

Monthly milestone updates require re-entering the same quantities across multiple POs and stages. No autofill, no bulk upload, no smart defaults.

No role-based access

NEW

Every user sees all data regardless of their role or the customers they manage. No access control = information overload + risk of accidental edits.

Technical debt

Database had inconsistencies, overlapping tables, and broken foreign key references. Hard to maintain or extend.

No analytics or alerts

Management has no information or dashboard to see division-level performance, PO expiry risks, or planned vs actual variance across all active opportunities.

User Analysis of existing portal

I am

responsible for tracking deployment progress across multiple customer opportunities.

I'm trying to

Monitor deployment status and update monthly Plan vs Actual quantities for each PO.

But

Updating the tracker requires navigating a large spreadsheet-like interface with repetitive input fields. The deployment workflow is difficult to follow.

Which makes me feel

Mentally drained and less engaged, slowing down my work and making important information easy to miss.

How Might We...

Understand where an opportunity is in the deployment journey at a glance?

Reduce repetitive monthly data entry without sacrificing accuracy?

Quickly identify delays, risks, and pending updates?

What's Changing

Drill-down navigation

UX

Opportunities → Products → POs → Milestones in one seamless flow. Click View on any opportunity to reach milestone tracking in two clicks, not five screens.

Planned vs actual variance

New

Quarterly milestone plans broken into monthly targets (m1/m2/m3). Actuals logged with remarks. Variance highlighted automatically per milestone stage.

Role-based access control

New

Super Admin · Manager · Field User · Viewer. Users only see customers and divisions assigned to them. Was not in the old portal — reduces overload and prevents accidental edits.

Deployment journey timeline

UX

Visual progress bar showing current stage: Hub → WH → Site → Install → Integration → RFS. Status-coded so delays and blocked stages are visible at a glance.

Alerts & smart defaults

Efficiency

PO expiry alerts, pending milestone update flags, and auto-carry of previous month's quantity to reduce re-entry. Filter to 'only show milestones needing updates'.

Analytics dashboard

New

Division-level breakdown of active opportunities, total PO value, and planned vs actual gap. Monthly activity log showing who changed what and when for accountability.

Role-Based Access Control

NOT IN OLD PORTAL

Users only see what they need to. Access is scoped by role, customer, and division.

Super Admin

Full system

- All data across all divisions & customers
- Master data: products, milestones, companies, users
- User management & access assignments
- Analytics dashboard & monthly reports
- Full audit log — who changed what, when
- Bulk upload & data export

Manager

Division scoped

- Create & manage opportunities and POs
- Full CRUD on challenges & challenge plans
- Review planned vs actual variance
- PO expiry alerts for their opportunities
- Export data to Excel / PDF
- View team activity within their division

Project Team

Customer scoped

- Enter actual deployment quantities monthly
- Auto-carry qty from previous milestone
- Filter to milestones needing updates only
- Log challenges and mitigation plans
- Add remarks explaining variance
- View only their assigned customers

Viewer

Read only

- Read-only view of assigned scope
- See planned vs actual — cannot edit
- View open challenges and plans
- Export to Excel / PDF
- No create, edit or delete access
- For stakeholders needing visibility only

Who Uses It & Why

Primary

Daily use · Core workflow

Project Team

Enter planned & actuals, track milestones, log challenges

Create opportunities & POs, review variance, manage challenges

Secondary

Regular use · Analysis & oversight

Senior Management / Leadership

Division KPIs, planned vs actual, monthly summary reports

Finance / Commercial Team

PO values, expiry alerts, deployment fulfilment rates

Tertiary

Occasional use · Audit & admin

HR / IT Admin

User management, access control, activity logs

Audit / Compliance

Change history, createdBy/updatedBy trail, exports

Customer (optional)

Read-only view of their own deployment progress

The primary stakeholders are the Delivery & Operations team — both the field users who enter data daily and the managers who create and review it. Role-based access ensures each tier only sees what's relevant to them.

Technical Improvements

Clean architecture

Strict Model → Route → Service separation in Flask. No circular imports. No raw SQL scattered across files.

Normalised database

20 tables in PascalCase with consistent FK references. Planned vs actual split into dedicated tables. All timestamps auto-filled.

Secure authentication

MD5+salt password hashing. Flask session management. Route-level role checks before any data is returned.

Dynamic frontend

Fetch API for drill-down panels — no full page reloads. DataTables for sortable, searchable, exportable tables. Bootstrap 5 throughout.

Bulk upload pipeline

Excel upload with status tracking (uploading → uploaded → error). Reduces manual data entry for large milestone datasets.

Audit trail

createdBy and updatedBy columns on every transactional table. Monthly activity log view for accountability.

Next Steps

Phase 1

Core portal — in progress

- Login Page with actual user info
- Opportunities list with status & drill-down
- PO display and add PO button
- Milestones layout
- Products Drill down

Phase 2

Analytics & efficiency

- Analytics dashboard (division KPIs, variance charts)
- PO expiry alerts & pending update flags
- Bulk upload for milestone data (Excel)
- Monthly activity log & audit trail
- Export to Excel / PDF

Phase 3

Advanced features
(suggested)

- Email notifications for milestone delays
- Auto-generated monthly summary report
- Smart autofill from previous month's actuals
- Optional: customer read-only portal access
- Mobile-responsive layout

One portal.
One workflow.
Every deployment, tracked.
